We offer the 'Integrated Debugger 78K0-QB' for the '78K0 Series'. This is a software tool that is installed on your computer after purchasing the Integrated Debugger 78K0-QB. With this Integrated Debugger 78K0-QB, you can debug using an OS/2 formatted PC. Features: • Easy and effortless debugging with a single click! • The Integrated Debugger 78K0-QB has the ability to automatically display the assembly code. • Manage the address range and register state for each program. • Debug multiple program objects in a single device. • Supports easy debugging of the program objects even when the device is in use (user program debugging) • Supports devices of the '78K0 Series'. • Supports the Integrated Debugger 78K0-QB 2.0. • Supports the Integrated Debugger 78K0-QB V3. • Supports devices of the '78K0 Series'. • Supports the Integrated Debugger 78K0-QB 3.0. • Supports devices of the '78K0 Series'. • Supports

"C12" and "F12" control the execution direction. When "C12" is on, the program execution continues from the start point. When "F12" is on, the program execution continues from the current address. "B" enters/exits the state for skipping a break point set by the user. "A" turns on/off all the break points set by the user. "C" turns on/off all the watch points set by the user. "G" turns on/off the watch point list which is set up when the tool is opened. "H" turns on/off the watch point list which is automatically generated. "J" and "K" start the watch list on/off and the instruction list on/off. "N" allows the user to see only the addresses that the tool selects. "P" allows the user to see only the values which the tool selects. "L" and "M" allow the user to see only the execution path in the user program. "Z" allows the user to see only the PC where the program execution ended. "1" and "2" allow the user to see only the command history. "T" shows the code of the instruction being executed. "C" turns on/off the code history. "D" turns on/off the break point list. "X" clears the code history. "ESC" exits the program execution mode. Start debugging using the debugger A "b" shortcut command is used to enter the watchpoint. In the watchpoint name, you can use a sequence of letters, numbers and the abbreviation (ex. "F00" means "the instruction F reads the Register 0"). The search function (the function of finding the start and end address) is often used in debugging. When you enter a command to debug, the emulator opens the emulator window. You can confirm the emulator window by displaying this icon. In this window, you can view the value of variables and the command list. "Watch points" and "Instruction history" are displayed in the emulator window. Start debugging using the debugger When the emulator window appears in the center 1d6a3396d6

What's New In?

78K0-QB, Integrated Debugger for the NEC 8-Bit MCU 78K0 Series When 78K0-QB starts up, you can select an executable file that is stored on the system's flash memory, for example, the file containing a bootloader for the 78K0 series microcontrollers. Upon execution of the file, 78K0-QB restarts and restores the original contents of the bootloader of the MCU 78K0 that was stored in the CPU. When the execution of the file has finished, 78K0-QB displays a progress screen and restarts the debugging program. During the debugging of the program, the contents of the flash memory are continuously displayed as the progress screen is updated. When a debugger program is running, the status display provides information regarding various statuses including the MCU's registers, the bitmap of the current executing memory area, and the line numbers of the debug target program. In the status display area, the stack pointer, program counter, and data register contents can be set as you would like. The user can also enter a break point address and a reset address in the same status display area. The status display area provides a system of shortcuts for scrolling forward or backward and setting a breakpoint and a memory watch. The integrated debugger for the NEC 8-bit microcontrollers has a refresh function for the display which allows you to make the screen more easily viewable. When 78K0-QB starts up, the system clock of the MCU will be set to an internal clock with a frequency that will support the maximum speed of the MCU's internal processor. When the execution of the debug target program has finished, 78K0-QB will show a message at the end of the debugging process, indicating that the debugging was successful. The integrated debugger for the NEC 8-bit microcontrollers is the most powerful debugger for the 78K0 series of 8-bit microcontrollers, and the command set is based on the buttons of an electronic device such as a calculator. It is possible to set all of the registers in the MCU to desired values, if you select the "Set All Registers" item when you restart 78K0-QB. Set the Maintainance Mode (Refresh Function) Next, the integrated debugger for the NEC 8-bit microcontrollers enables the "Refresh Function", so that the display data of the MCU will be refreshed after a certain period. In this function, the MCU's internal clock is synchronized to the clock of the external oscillator by changing the MCU's clock division ratio. Use the Integrated Debugger Next, the integrated debugger for the NEC 8-bit microcontrollers for example, makes debugging of the program that is stored on the flash

System Requirements For 78K0-QB Integrated Debugger:

PC Requirements: Minimum: OS: Windows 7 64-bit, Windows Vista 64-bit, Windows 8 64-bit, Windows 8.1 64-bit Processor: Intel Core 2 Quad Q9300 @ 2.8GHz Memory: 6 GB RAM Hard Disk Space: 16 GB of free disk space Graphics: NVIDIA GeForce 8800 GT 512MB DirectX: Version 9.0 Network: Broadband Internet connection (broadband recommended) Widescreen (or high resolution) display
