NetBeans 7.1 NetBeans provides a suite of productivity tools and reusable components to Java, C++, C, Python, and a growing number of other languages NetBeans has a number of features that make it more convenient to write, edit, compile, and debug Java, C++, and C. These features include an intelligent source code assist, a powerful refactoring engine, a powerful find and replace engine, and the ability to run and debug Java applets and client/server applications. Today, NetBeans is the world's most popular tool for writing and developing Java applications. The NetBeans IDE enables developers to write Java applications in a wide variety of ways, including a custom language called Groovy (see the section on NetBeans 7.0) NetBeans 7.0 Java 3D is a toolkit designed to help developers to build 3D graphics applications using the Java 3D API. It is based on scene graph

data structures, hence it can handle 3D models and 3D scene graph data structures without building the entire scene. It offers a high-level application programming interface that runs along with OpenGL or Direct3D, enabling developers to work with three-dimensional objects in a Java-based application. Java is one of the most popular programming languages, mainly because of its cross-platform compatibility. Java 3D provides classes, components and objects that can be used for generating and handling 3D structures. Developers: use it with Java or any application that uses Java Swing. Publishers: use it with Java or any application that uses Java Swing. Educators: use it with Java or any application that uses Java Swing. Java 3D guarantees the compatibility of the API with Java SE 5.0 or later, whereas Java 3D SDK support Java SE 6.0.

Why Use Java 3D? Java 3D enables you to quickly develop the 3D scenography in your desktop or web applications. You can use classes to create various 3D objects including blocks, cubes, cylinders and surfaces in 3D scenes. You can also create surfaces and particles with 3D views to create complex and interesting visualizations. You can use 3D objects and advanced 3D lights to create realistic effects. You can apply various textures, colors and material effects to your 3D objects, allowing you to create a variety of 3D objects. Java 3D can be used with multiple programming models, including Java and HTML. Java 3D SDK Java 3D supports a range of APIs, including Java 2D, Java 3D and Java AWT. What's New in Java 3D? Java 3D 1.2 Release Notes Addition of the new 3DFile class, this allows to create a variety of 3D files such as OBJ, LWO, COLLADA and other formats on a single platform. Added function to create V3D files with Java 3D. Added dependency to Java Runtime Environment (JRE) 6. Java 3D now allow to set the window size to have a 32x32 pixel appearance. Java 3D now allows to use mouse to control 3D views. Added a function to count the number of 3D objects in Java 3D scene. What Does Java 3D Provide? -Java 3D Scene Graph - the scene graph data structure is Java API based. -Java 3D Basic Shape - provides basic 3D shape classes. -Java 3D Scene graph - The Scene Graph API interface offers various methods to manipulate 3D scenes. -Java 3D Environment API - provides different ways of manipulating a scene. -Java 3D Transform - offers an easy-to-use set of classes to create or scale, translate or rotate 3D objects. -Java 3D Arrays - offers a two-dimensional Array based on Java 2D objects. -Java 3D

Java 3D is an open-source SDK, designed and developed by Sun Microsystems and provided as an open source project under the GNU General Public License. The programming language that works with Java 3D is called Java3D, and uses the Java programming language to create 3D objects and scenes. The program comes with a set of interfaces that enable software developers to create and display 3D effects in their programs. It also comes with a sophisticated API that allows users to manipulate geometry, materials, textures, transparency, 3D vector mathematics, lighting and shading. Java 3D is used for a wide range of purposes, from developing visualization and graphics programs to game development and high-performance 3D applications. The GUI uses a scene graph-style data structure to enable developers to generate and render 3D scenes, enabling users to interact with objects using the mouse and keyboard. Java 3D comes with stereo sound support, allowing developers to produce more realistic 3D scenes. In the 3D rendering mode, Java 3D has a powerful and reliable stereoscopic rendering engine. It also supports the use of head-mounted displays (HMDs), taking advantage of the new headtracking technology to enhance 3D scenes with depth perception. Java 3D is bundled with the 3D interface and viewer utilities that can be used to create any kind of 3D model, manage imported 3D data, and display them in a 3D viewport. Java 3D now comes with a completely rewritten 3D file format for 3D scene data. It also provides support for scene graph data structures and allows developers to work with a new API and core classes that integrate 3D scene properties into their programs. In Java 3D, data is stored with both scene graph and file formats. When stored in the latter format, it will generate a Java3DFile object for each scene in the file. When stored in the scene graph format, a Java3DScene object is generated for each scene in the file. Java3DFile and Java3DSnape already implement the scene graph format, and new data files will be written to the Java3DFile and Java3DSnape libraries. Java3D does not require file format extensions to create or load new data files. Using the Java3DFile interface, Java3D is an open source SDK to create and display 3D scenes in Java applications. With Java3DFile, users can load and save Java3D scenes from and to various Java3D scene formats.

### What's New In Java 3D?

Java 3D Classes and Components for 3D Graphics Programming (C/C++) Java 3D API is a high-level application programming interface (API) that runs with a graphical toolkit such as OpenGL or Direct3D. It enables programmers to develop and create 3D graphics within the Java programming language. The components include classes, components and objects that enable programmers to work with 3D structures and renderings. Java is a cross-platform programming language that can be used on desktop and web applications on most of today's popular operating systems including Windows, Linux and Macintosh. The Java 3D API allows users to manipulate objects in 3D space with Java. It is closely integrated with the Open GL and Direct3D API. The third-party components provide functionality in scene graph data structures. The Java 3D API is an extension to the Java SE platform, enabling developers to create sophisticated 3D graphics in a Java-based program. The software package provides classes, components and objects to generate and render 3D structures. Java 3D supports a model-based approach to programming. A model is a set of data that defines the 3D structure and objects that need to be rendered. Java 3D API Unlike other programming interfaces such as Java2D, the Java 3D API enables programmers to work directly with 3D constructs. It comes with a set of interfaces that can be used to manipulate 3D structures and renderings. Some of the interfaces focus on rendering and manipulating 3D objects, shapes and textures. Java 3D supports object-oriented programming practices and supports the

concepts of classes, components and objects. The structure includes interfaces that expose Java's core functionality to users. The Java 3D API is a collection of APIs and components that are used to access, manipulate and display data. The package includes classes, components and objects that can be used for designing, rendering and displaying 3D structures. The Java 3D API is an extension to the Java SE platform, providing a set of interfaces that can be used to access, manipulate and display 3D structures. Java 3D API Includes the following interfaces: Geometry Geometry Interface The Geometry interface represents the 3D objects in Java, providing methods for manipulating objects within a Java-based application. The object type is an abstract class that derives from the Geometry interface. The Geometry interface includes the following methods: geometry Set
